TodoAPIDocumentation

This is an Api to help you keep track of tasks that need to be done, and categories to assign the tasks to. In this Api, you can save the task to the database, view your tasks, update them, and delete them when done. You can also create, view, update and delete categories for your tasks. The Api requires you to create a user by signing up, then logging in to access the todo functionality

Authenticaiton

These request are used to signup to the Api, and logging in so that the functionality becomes available.

POST Sign up new user

`http://localhost:3000/signup`

The signup request takes three parameters in the body of the request:

- Name
- Email
- Password

Below are a successfull and a negative example for this request.

Body raw (json)

```
json
```

```
{
  "name": "example",
  "email": "example@gmail.com",
  "password": "examplePassword"
}
```

POST Login user to access functionality

http://localhost:3000/login

The login request takes two parameters in the request body:

- Email
- Password

This request will return a token in the response body. Copy this token and place it as a Bearer token in the authorization tab to use the todo-functionality.

Below are a successful and a negative example for this request.

Body raw (json)

json

```
{
  "email": "example@gmail.com",
  "password": "examplePassword"
}
```

Basic Todo Operations

Here are examples for the todo-request.

To access all these, take the token from the login request, and paste it as a bearer token in the authorizations tab.

GET Get all todo items

http://localhost:3000/todo

This Get request return a list of all items that have been logged in the database. If there are no items available, the request is still successfull, but message will prompt you that there are no items to view.

Below are a successfull and a negative example for this request.

AUTHORIZATION Bearer Token

Token <token>
